#### 4.4 安装说明 Installation instruction

仪表安装时，松开固定支架锁紧螺钉，取下固定支架，将仪表嵌入安装孔内，装上固定支架，拧紧螺钉，使仪表安装牢固，不松动即可。48外形为卡簧片挤压安装。

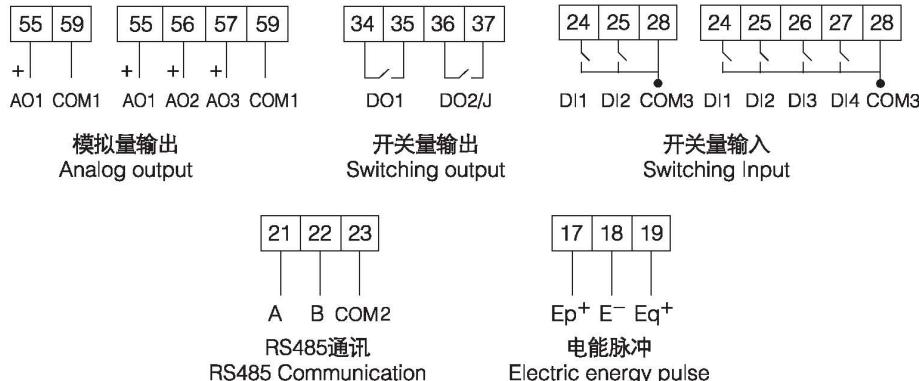

When meter is installing, loosen locking screw of fixed support, take down fixed support , embedded meter into mounting hole, restore fixed support, tighten screw, fix meter firmly.

#### 4.5 端子及接线 Terminal and connection

##### 4.5.1 辅助电源与信号输入端子 Auxiliary power and signal input terminal

##### 4.5.2 附加功能端子 Additional function terminal

注:

1. 符号“\*”表示电流进线端，该接线仅供参考，具体以仪表上接线图为准；
2. 报警输出继电器与开关量输出DO2复用。

Note:

1. Sign “\*” show current inlet, this connection is only for reference, take the wiring diagram on the meter as standard;
2. Alarm output relay duplex with switching output DO2.

#### 4.6 注意事项 Notice

##### 4.6.1 电压输入 Voltage Input

输入电压不得高于产品的额定输入电压的120%，否则应考虑使用PT；

在电压输入端须安装1A保险丝；

Input voltage shall not exceed 120% of product rated input voltage, otherwise PT shall be used;

On the voltage input end, 1A fuse shall be fitted;

##### 4.6.2 电流输入 Current Input

电流输入应使用外部CT；

如果使用的CT上连有其它仪表，接线应采用串接方式；

建议使用接线排，不要直接接CT，以便拆装；

去除产品的电流输入连线之前，一定要先断开CT一次回路或短接二次回路。

Current input shall use external CT;

If the used CT connected with other meters, the connection is adopting series connection mode;

When wiring, using Connector bar is recommended, not connected with CT directly, to facilitate dismantling;

Before removing product current Input connection, firstly, cutoff CT primary circuit or short the secondary circuit.

##### 4.6.3 附加功能接线 Adding function connection

模拟量输出与开关量输入的COM表示各自公共端，并不是实际接地；

该仪表提供异步半双工RS485通讯接口，采用MODBUS-RTU协议，各种数据信息均可在通讯线路上传送。理论上在一条线路上可以同时连接多达128个仪表，每个仪表均可设定其通讯地址（Addr）、通讯速率（baud）也可通过设置选择。

通讯连接建议使用三芯屏蔽线，每芯截面不小于0.5mm<sup>2</sup>，分别接A、B、COM2，屏蔽层接大地，布线时应使通讯线远离强电电缆或其他强电场环境。

COM of analog output and switching Input show that the common port is not earthing actually.

Between analog output and switching input, common port is not connected;

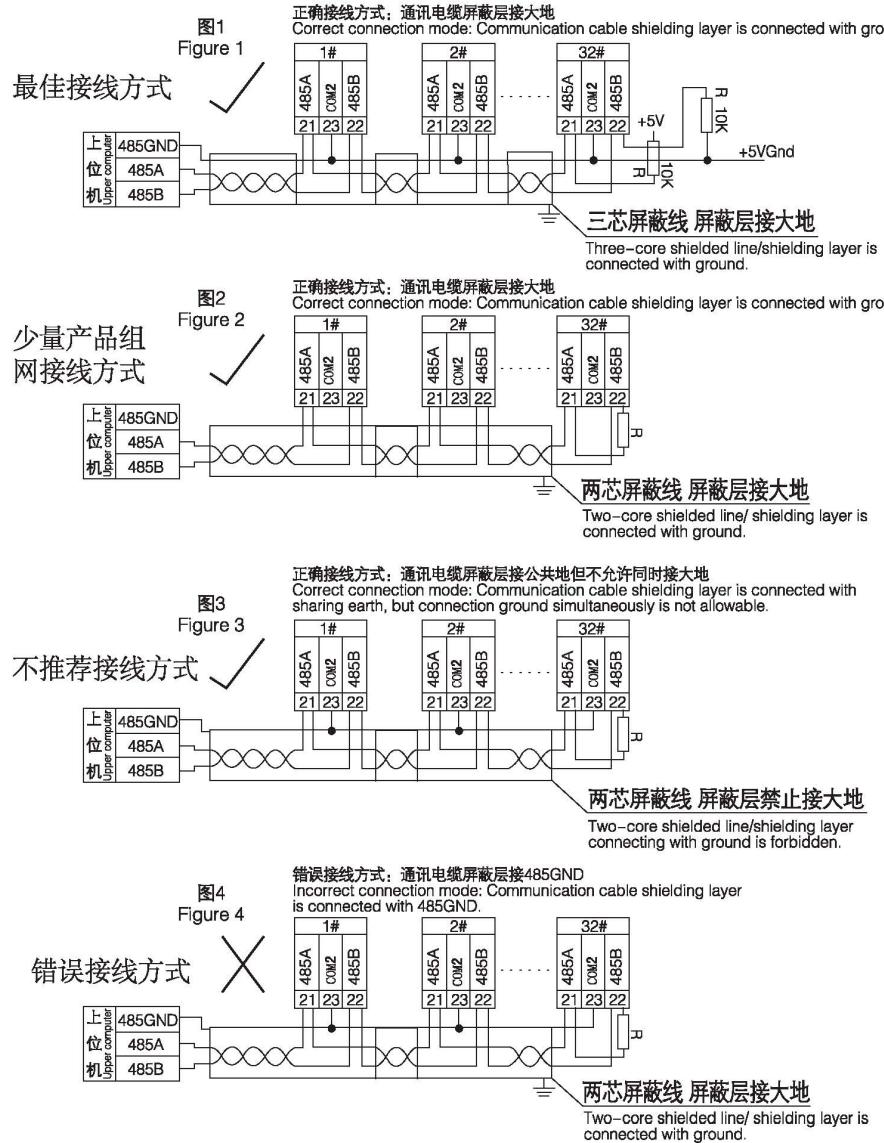

This meter provides asynchronous half duplex RS485 Communication interface, adopts MODBUS-RTU protocol, various data information may be transmitting on the Communication line. Theoretically, on the same line, meters up to 128 may be connected at the same time, each meter can set up its Communication address (Addr), Communication rate (baud) may be selected.

Communication connection recommendation of three - core shielded wire, its linear diameter is no less than 0.5mm<sup>2</sup>, separately connecting A,B,COM2, the shielded layer connecting earth, when wiring, the Communication line shall be far away from strong

Current cable or other strong electric field environment.

关于通讯部分的接线实例如下图所示:

Four connection mode in communication section are shown as following:

建议最末端仪表的A、B之间加匹配电阻，阻值范围为120Ω~10kΩ。

Recommendation of adding matched resistance between A, B of the last meter, the rated resistance range is 120Ω~10kΩ.

## 6 通讯指南 Communication guide

### 6.1 概述 General

PZ系列仪表采用Modbus-RTU协议：“9600, 8, n, 1”，其中9600为默认波特率，可通过编程修改为2400、4800、19200等，设置方法见本说明书5.4.3 通讯参数设置；8表示有8个数据位；n表示无奇偶校验位；1表示有1个停止位。

错误检测：CRC16（循环冗余校验）

### 6.2 协议 Protocol

当数据帧到达终端设备时，它通过一个简单的“端口”进入被寻址到的设备，该设备去掉数据帧的“信封”（数据头），读取数据，如果没有错误，就执行数据所请求的任务，然后，它将自己生成的数据加入到取得的“信封”中，把数据帧返回给发送者。返回的响应数据中包含了以下内容：终端从机地址（Address）、被执行了的命令（Function）、执行命令生成的被请求数据（Data）和一个CRC校验码（Check）。发生任何错误都不会有成功的响应，或者返回一个错误指示帧。

#### 6.2.1 数据帧格式 Data frame format

地址 Address	功能 Function	数据 Data	校验 Check
8-Bits	8-Bits	N × 8-Bit	16-Bits

PZ Series meter adopt Modbus-RTU protocol: "9600, 8, n, 1", in it 9600 is default baud rate, based on request, it can be revised as 2400, 4800, 19200 etc., for the setting method, see this instruction 5.4.3 communication parameter setting; 8 indicate have 8 data bit; n indicate no parity bit; 1 indicate have one stop bit.

Error detecting: CRC16 (cyclic redundancy check)

#### 6.2.2 地址 (Address) 域 Address domain

地址域在帧首，由一个字节（8-Bits, 8位二进制码）组成，十进制为0~255，在我们的系统中只使用1~247，其它地址保留。这些位（Address）标明了用户指定的终端设备的地址，该设备将接收来自与之相连的主机数据。同一总线上每个终端设备的地址必须是唯一的，只有被寻址到的终端才会响应包含了该地址的查询。当终端发送回一个响应，响应中的从机地址数据便告诉了主机哪台终端正与之进行通信。

Address domain: address domain is located at beginning of frame, composed of one byte (8 bit binary system domain), decimal system is 0~255, in our system, just 1~247 is used, other address is Reserved. these bits indicate terminal device address specified by users, this device will receive the connecting host computer data. Every terminal device has its only one address, only the addressing terminal is responding enquiry including this address. When terminal is Transmitting one responding, the responding slave address data tell host computer that which terminal is communicating with it.

#### 6.2.3 功能 (Function) 域 Function domain

功能域代码告诉了被寻址到的终端执行何种功能。下表列出了该系列仪表用到的功能码，以及它们的意义和功能。

Function domain: function domain tell the addressed terminal to execute what function. Below table list: function domain used in this Series meters, and their meaning and function.

代码(十六进制) Code(hex)	意义 Meaning	行 Operation
03H	读取保持寄存器 Read holding register	在一个或多个保持寄存器中取得当前的二进制值 Obtain current binary system value of one or multiple holding register
10H	预置多寄存器 Preset multiple register	把具体的二进制值装入一串连续的保持寄存器 Set actual binary system value into a series of continuous holding register

#### 6.2.4 数据 (Data) 域 Data (Data) fields

数据域包含了终端执行特定功能所需的数据或终端响应查询时采集到的数据。这些数据可能是数值、参量地址或者设置值。

Data field: data field is including the data needed by terminal for executing specific function, or the collected data when terminal is responding enquiry. Content of these data may be value, reference address or setting value. For example: The function domain tell terminal to Read one register, the data field need to specify the starting register and Read how many data, the built-in address and data have different content depending on type and slave computer.

例如：功能域告诉终端读取一个寄存器，数据域则需要指明从哪个寄存器开始及读取多少个数据，内嵌的地址和数据依照类型和从机之间的不同而内容有所不同。

### 6.2.5 错误校验 ( Check ) 域 Error check ( Check ) domain

该域采用CRC16循环冗余校验，允许主机和终端检查传输过程中的错误。有时由于电噪声和其它干扰，一组数据从一个设备传输到另一个设备时，在线路上可能会发生一些改变，错误校验能够保证主机或从机不去响应那些发生改变的数据，这就提高了系统的安全性、可靠性和效率。

This domain adopt CRC16 cyclic redundancy check, for host computer and terminal, the error in checking and transmitting is allowable. Due to electric noise and other interfere, when one group of data is transmitting from one device to another device, on the transmitting line, some change may be produced. The error check can enable the host computer or slave computer not responding those changed data, so, safety, reliability and efficiency of system are upgraded.

### 6.3 错误校验码(CRC)的生成方法

Method to create error check code (CRC)

错误校验 ( CRC ) 域占用两个字节，包含了一个16位的二进制值。CRC值由传输设备计算出来，然后附加到数据帧上，接收设备在接受数据时重新计算CRC值，然后与接收到的CRC域中的值进行比较，如果这两个值不相等，就发生了错误。

Error check (CRC) domain occupy 2 byte, including one 16 bit binary system value. CRC value is calculated by transmission device, then attached to the data frame, the receiving device, while receiving, it calculates the CRC value again, then comparing it with the receiving CRC domain value, if these two values is not equal, it shows a error occurs.

CRC运算时，首先将一个16位的寄存器预置为全1，然后连续把数据帧中的每个字节中的8位与该寄存器的当前值进行运算，仅仅每个字节的8个数据位参与生成CRC，起始位和停止位以及可能使用的奇偶位都不影响CRC。在生成CRC时，每个字节的8位与寄存器中的内容进行异或，然后将结果向低位移位，高位则用“0”补充，最低位 ( LSB ) 移出并检测，如果是1，该寄存器就与一个预设的固定值 ( 0A001H ) 进行一次异或运算，如果最低位为0，不作任何处理。

When operating, firstly, preset one 16-bit register as All-1, then continuously operating each byte 8 bit of Data frame and current value of this register, only every 8 data bit of each byte to participate in forming CRC the start bit and stop bit and usable parity bit have no affect on the CRC. When forming CRC, every 8 data bit of each byte and content of register carry out exclusive or operation, then shift the result to the low bit the high bit is filled with 0, shift out the least significant bit (LSB)is shifted out and tested, if it is 1, this register and one preset fixed value (0A001H) carry out one exclusive or operation, if the least significant bit is 0, no treating is needed.

### CRC生成流程:

1 预置一个16位寄存器为0FFFFH ( 全1 ) ,称之为CRC寄存器。

2 把数据帧中的第一个字节的8位与CRC寄存器中的低字节进行异或运算，结果存回CRC寄存器。

3 将CRC寄存器向右移一位，最高位填0，最低位移出并检测。

4 如果最低位移出为0: 重复第3步 ( 下一次移位 ) ；如果最低位移出为1: 将CRC寄存器与一个预设固定值 ( 0A001H ) 进行异或运算。

5 重复第3步和第4步直到8次移位。这样就处理完了一个完整的8位。

6 重复第2步到第5步来处理下一个8位，直到所有的字节处理结束。

7 最终CRC寄存器的值就是CRC的值。

此外还有一种利用查表计算CRC的方法，

它的主要特点是计算速度快，但是表格需要较大的存储空间，该方法此处不再赘述，请查阅相关资料。

### Flow for forming one CRC:

1, Preset one 16 bit register as 0FFFFH (All-1), called as CRC register.

2, 8 bit of data frame first byte and low byte of CRC register carry out exclusive or operation, then save its result back to CRC register.

3, Right shift CRC register for one bit, the most significant bit is filled with 0, the least significant bit is shifted out and tested.

4, If the least significant bit is 0, Repeat the third step (next shift); If the least significant bit is 1, CRC register and preset fixed value specified (0A001H) carry out exclusive or operation.

5, Repeat the third step and the fourth step until shift for 8 times, the complete 8 bit is done.

6, Repeat the second step to the fifth step to treat next 8 bit until all the byte is treated.

7, The CRC register final value is CRC value.

Besides, there is another CRC calculation method by preset table, its main feature is fast calculating speed, but large saving space is needed, please refer to related data.

- 04: Hex, decimal system is 4, show follow by 4 byte data
- 5a 50: Cyclic redundancy check code
- Data processing method see: 6.4 communication parameter address table
- Data processing:

  - 03 b2 (Hex) = 946 (decimal system)
  - 00 00 (Hex) = 0 (decimal system)

- Calculation:  $946 \times 10^{-3} = 0.946$ ;
- Unit: A

Read voltage meter data is similar with that of read current meter, but starting address is 00H, inquiry frames: 01 03 00 00 00 02 c4 0b

Read inquiry frames of other information is same as this format, each information address see: 6.4 Single-phase meter communication parameter address table.

## 例2: 读有功电能数据

Example2: Read active electric energy data

查询数据帧 Inquiry Data frame	01 03 00 0c 00 02 04 08
返回数据帧 Return Data frame	01 03 04 00 00 30 26 6f e9

## 数据处理:

高位: 00 00(16进制) = 0 (10进制)  
 低位: 30 26(16进制) = 12326 (10进制)  
 因此该仪表二次侧测有功电能为:  $(0 \times 65536 + 12326)/1000 = 12.326$  单位: kWh  
 无功电能作相同处理; 如需一次测电能数据, 请自行乘以电压、电流变比。

## Data processing:

High bit: 00 00 (Hex) = 0 (decimal system)  
 Low bit: 30 26 (Hex)=12326 (decimal system)  
 Secondary side active electric energy of this meter is:  $(0 \times 65536 + 12326)/1000 = 12.326$  Unit: kWh  
 Reactive electric energy is doing same processing; if electric energy data of primary is needed, please multiply transformation ratio of voltage, current.

## 6.5.2 写数据 Read in data

## 例3: 开关量输出远程控制 (控制字: 0012H)

Example3: Switching output remote control (control character: 0012H)

写入数据帧 Read in data frames	01 10 00 12 00 01 02 00 02 24 e3 (DO1闭合) (DO1 closing) 01 10 00 12 00 01 02 00 01 64 e2 (DO2闭合) (DO2 closing) 01 10 00 12 00 01 02 00 03 e5 23 (DO1、DO2闭合) (DO1, DO2 closing)
返回数据帧 Return Data frame	01 10 00 12 00 01 A1 CC ( 不成功, 无返回 ) (no success, no returning)

## 说明:

向开关量输出状态位远程写入1, 则闭合;  
 写入0, 则断开。

当继电器闭合持续时间为非0时 (0为长闭), 继电器闭合持续时间为所设值。

## Description:

To Switching output status bit, remote read in 1, then closing; read in 0, then opening.  
 When relay closed duration is nonzero (0 is long closed), relay closed duration is the setting value.
